

GRAIN MILL

Faribon 600

Discription

Faribon 600 is a grinding mill which serves domestic and laboratory purposes around the wheat milling process. It is a bench-top unit, compact and functional with excellent performance and easy use. It can be used to grind grain and dry materials, such as hard wheat, soft wheat, mixed wheat, corn, barley, rice, coffee etc. Its big advantage is that with only one passage of the grain it automatically separates the bran from the flour, collecting them from different outlets and into different containers.

The unit consists of a pair of millstones made of steel and with adjustable inter-space. This feature combined with interchangeable sieves, which are included, gives us the capability to obtain any kind of cereal.

Faribon 600 is made entirely of stainless steel 304. It requires the minimum possible maintenance (definitely a periodic cleaning), providing functionality and high performance for a very long time.
